

CHILLED WATER PLANT - WATER-COOLED - PRIMARY/SECONDARY CH WATER DISTRIBUTION

1. INTRODUCTION

This sample functional performance test (FPT) procedure is for a hypothetical water-cooled chilled water plant with primary / secondary chilled water distribution.

The following system diagram is intended to communicate information about this hypothetical system and is not required to be included as part of any FPT.

BCS INPUTS/OUTPUTS	SENSORS	DEVICES	
(AI) ANALOG INPUT	(CS) CURRENT	2-WAY VALVE	(HOA) HAND-OFF-AUTO SWITCH
(AO) ANALOG OUTPUT	(F) FREEZE PROTECTION	3-WAY VALVE	(PANEL) LOCAL PANEL
(DI) DISCRETE INPUT	(FL) FLOW	(AFD) ADJUSTABLE FREQUENCY DRIVE	(P) PRESSURE GAUGE
(DO) DISCRETE OUTPUT	(P) PRESSURE	(FM) FLOW METER	(PT) PRESSURE/TEMP. STATION
	(T) TEMPERATURE		(P) PUMP
			(T) THERMOMETER

## 2. NOTABLE SYSTEM FEATURES

The purpose of this section is to identify notable system features to facilitate an understanding of system operation.

Notable system features include:

- a. Each chiller is selected to meet 50-percent of system requirements yielding no redundant chiller.
- b. Each chilled water distribution pump is selected to meet 100-percent of a single chiller's requirements yielding one redundant pump.
- c. Each cooling tower is selected to meet 100-percent of a single chiller's requirements yielding no redundant cooling tower.
- d. Each condenser water pump is selected to meet 100-percent of a single chiller's requirements yielding one redundant pump.
- e. Terminal equipment is selected such that system net temperature change is always greater than chiller evaporator temperature change ensuring system chilled water demand never exceeds that allowed by active chillers.
- f. [Cooling tower optimization](#) control algorithm maintains lowest allowable condenser water temperature to minimize chiller energy usage.
- g. [Condenser water pumping](#) control algorithm maintains minimum flow equivalent to the maximum flow required by either the number of chillers with open condenser valves and flow required by the number of active condenser water pumps:  
$$\text{Min Flow} = \text{Max}((\text{Open Cond Valves})(\text{Flow} / \text{Chiller}), (\text{Active Pumps})(\text{Flow} / \text{Pump}))$$
- h. [Distribution pumping optimization](#) control algorithm resets pump speed based on valve position of terminal equipment to minimize distribution pump energy usage.
- i. [Chilled water bypass](#) control algorithm maintains minimum flow equivalent to the maximum flow required by either the number of chillers with open evaporator valves and flow required by the number of active distribution pumps:  
$$\text{Min Flow} = \text{Max}((\text{Open Evap Valves})(\text{Flow} / \text{Chiller}), (\text{Active Pumps})(\text{Flow} / \text{Pump}))$$
- j. [Cooling tower bypass](#) control algorithm maintains condenser water supply temperature by diverting flow around towers during low load conditions.
- k. [Plant activation](#), [multiple chiller operation](#), [single cooling tower operation](#), and [multiple cooling tower operation](#) control algorithms inherently include duty status rotation for all equipment by setting next active equipment equivalent to the inactive equipment with shortest runtime.
- l. [Plant deactivation](#) operation mode includes Operator options to not set or to set plant deactivation parameters for stable chiller operation based on plant and connected load characteristics.
  - Deactivation option one allows setting minimum running load current of last enabled chiller and period required to disable next inactive chiller circuit / to deactivate plant, and / or
  - Deactivation option two allows setting minimum system load and period required to disable next inactive chiller circuit / to deactivate plant

- m. **Plant activation** operation mode includes Operator options to not set or to set staged plant activation parameters for stable chiller operation based on plant and connected load characteristics.
  - Stage one activation allows setting minimum number of system terminal equipment control valves commanded from their 0-percent open position and period required to enable next active distribution pump, and
  - Stage two activation allows setting minimum system flow rate and period required to enable next active chiller circuit
- n. **Multiple chiller** operation mode includes Operator options to not set or to set parameters to enable next active chiller circuit and to disable next inactive chiller circuit for maximized plant efficiency based on plant characteristics.
  - Activation option one allows setting minimum running load current of last enabled chiller and period required to enable next active chiller circuit, and / or
  - Activation option two allows setting minimum system load and period required to enable next active chiller circuit
  - Deactivation option one allows setting minimum running load current of last enabled chiller and period required to disable next inactive chiller circuit, and / or
  - Deactivation option two allows setting minimum system load and period required to disable next inactive chiller circuit
- o. **Multiple chiller** operation mode includes calculation of actual load based on supply water setpoint temperature, chiller loop return water actual temperature, and chiller loop actual flow to maintain an accurate load calculation during transition time during manufacturer's initial load limiting initiated when next active chiller's evaporator isolation valve is commanded to its 100-percent open position.
- p. **Low chilled water return temperature** alarm condition includes visual indication of net system temperature change being significantly less than design thus negatively impacting central plant efficiency.

### 3. CONCLUSIONS AND RECOMMENDATIONS

The purpose of this section is to identify conclusions and recommendations based on control system feature observations, point-to-point observations, actuator observations, and system operation observations.

It is concluded that this system [does / does not perform] in accordance with contract requirements.

It is recommended that this system [be / not be] accepted by the government.

The following system control enhancements are recommended:

4. TEST CONDITIONS

The purpose of this section is to identify conditions occurring at time of testing.

Test date: \_\_\_\_\_  
Test begin time: \_\_\_\_\_  
Test end time: \_\_\_\_\_  
Test begin outside air temp: \_\_\_\_\_  
Test end outside air temp: \_\_\_\_\_

5. EQUIPMENT IDENTIFICATION

The purpose of this section is to identify equipment included in this system.

Chiller: \_\_\_\_\_  
Chiller: \_\_\_\_\_  
Cooling tower: \_\_\_\_\_  
Cooling tower: \_\_\_\_\_  
Distribution pump: \_\_\_\_\_  
Distribution pump: \_\_\_\_\_  
Distribution pump: \_\_\_\_\_  
Condenser water pump: \_\_\_\_\_  
Condenser water pump: \_\_\_\_\_  
Condenser water pump: \_\_\_\_\_

6. ATTENDEES

The purpose of this section is to identify persons present during system functional performance testing.

ATTENDEES			
REPRESENTING	NAME	COMPANY	TELEPHONE NUMBER
Mechanical Commissioning Specialist:			
Owner's Representative:			
Mechanical Contractor:			
Controls Contractor:			
Test & Balance Contractor:			

7. CONTROL SYSTEM FEATURE OBSERVATIONS

The purpose of this section is to identify control system features including control point description, imbedded / visible type, adjustable / monitoring type, actual value, setpoint value / alarm range.

Abbreviations used in the matrix below include:

a. Unit:

Unit of measure for control point.

b. Imbedded / Visible:

I - Imbedded such that control point is not observable by Operator.

V - Visible such that control point is observable by Operator.

c. Type:

A1 - Both setpoint and minimum / maximum alarm or alarm range are adjustable by Operator.

A2 - Only minimum / maximum alarm or alarm range is adjustable by Operator.

A3 - Only setpoint is adjustable by Operator.

M - Control point is visible, but not adjustable by Operator.

d. Value / Status:

As-found imbedded or visible value or status of control point observed prior to control point(s) manipulation.

A - Status of control point is in alarm.

N - Status of control point is normal operation.

e. Setpt / Alarm Range:

Alarm Min - Alarm activated when actual value is equal to or less than alarm activation setpoint.

Setpt - Setpoint.

Alarm Max - Alarm activated when actual value is equal to or greater than alarm activation setpoint.

CONTROL SYSTEM FEATURES								
POINT DESCRIPTION	UNIT	VISIBLE / IMBEDDED	TYPE	VALUE / STATUS	SETPT / ALARM			NOTES
					ALARM MIN	SETPT	ALARM MAX

8. POINT-TO-POINT OBSERVATIONS

The purpose of this section is to identify system meters and sensors have been calibrated.

Abbreviations used in the matrix below include:

a. Display:

As-found imbedded or visible value of control point documented at Operator workstation at same time measurement or observation occurred and prior to control point(s) manipulation.

Value / status is recorded for both locations when control point is displayed locally at equipment Operator workstation.

b. Measured / Observed:

As-found imbedded or visible value of control point measured or observed at same time documentation of value at Operator workstation occurred and prior to control point(s) manipulation.

POINT-TO-POINT			
POINT DESCRIPTION	DISPLAY (LOCAL / CONTROL SYSTEM)	MEASURED / OBSERVED	NOTES
Chiller (___):

9. ACTUATOR AND MOTOR OBSERVATIONS

The purpose of this section is to identify actuator responses to commands from the control system.

Abbreviations used in the matrix below include:

a. Type:

A - Actuator / controlled device is controlled by an analog control signal.

D - Actuator / controlled device is controlled by a discrete (binary) control signal.

b. Maximum Command:

Control system command resulting in actuator moving controlled device to its full open position with maximum / full flow across device.

c. Minimum Command:

Control system command resulting in actuator moving controlled device to its full closed position with minimum / no flow across device.

d. Signal:

Output from control system measured in units of 0 to 100 percent, 0 to 10 volts, etc.

e. Position:

Position of controlled device (not actuator) physically observed that corresponds to control system signal observed in units of 0-percent open (minimum / no flow across device) and 100-percent open (maximum / full flow across device).

ACTUATORS AND MOTORS						
ACTUATOR DESCRIPTION	TYPE	MAXIMUM COMMAND		MINIMUM COMMAND		NOTES
		SIGNAL	POSITION / SPEED	SIGNAL	POSITION / SPEED	
Chiller (___):						
Evaporator isolation valve						
Condenser isolation valve						
Chiller (___):						
Evaporator isolation valve						
Condenser isolation valve						
Cooling tower (___) isolation valve						
Cooling tower (___) isolation valve						
Chilled water bypass valve						
Cooling tower bypass valve						

ACTUATORS AND MOTORS						
ACTUATOR DESCRIPTION	TYPE	MAXIMUM COMMAND		MINIMUM COMMAND		NOTES

Distribution pump (___) speed						
Distribution pump (___) speed						
Distribution pump (___) speed						
Condenser water pump (___) speed						
Condenser water pump (___) speed						
Condenser water pump (___) speed						

#### 10. VARIABLE FREQUENCY DRIVE OBSERVATIONS

The purpose of this section is to identify characteristics of variable frequency drives (VFD's).

Procedure for obtaining characteristics included:

a. Procedure for documenting maximum motor speed allowed by VFD included:

- Record served motor's nameplate full load current
- Confirm / manually set VFD's maximum allowed speed of 60 Hz
- Manually set VFD hand-off-auto switch to "hand" position
- Manually set VFD to maximum allowed speed of 60 Hz
- Record served motor's running load current at motor conductors

b. Procedure for documenting minimum safe motor speed allowed by VFD included:

- Manually set VFD speed to 24 Hz
- Repeatedly decreased VFD speed by 3 Hz and recorded served motor's running load amperes until running load amperes increases
- Set VFD's minimum allowed speed equivalent to speed at which running load amperes increased plus 3 Hz
- Manually set VFD speed to VFD's minimum allowed speed
- Record served motor's running load amperes at motor conductors

VARIABLE FREQUENCY DRIVE INFORMATION														
PARAMETER DESCRIPTION	SERVED EQUIPMENT													
Data for maximum motor speed allowed by VFD:														
Motor nameplate full load current														
VFD maximum allowed speed (Hz)														
Running load current with VFD at 60 Hz														
Data for minimum safe motor speed allowed by VFD:														
Current at 24 Hz														
Current at 21 Hz														
Current at 18 Hz														
Current at 15 Hz														
Current at 12 Hz														
Current at 9 Hz														
Current at 6 Hz														
Minimum allowed speed (Hz)														
Current at minimum allowed speed (Amps)														

## 11. SYSTEM OPERATION OBSERVATIONS

The purpose of this section is to document results from system-based testing of responses for each control algorithm, operation mode, and alarm condition resulting from manipulated control point(s).

Testing is sequentially grouped based on similar functions to maximize testing efficiency and is categorized as follows:

- a. [As-found conditions.](#)
- b. [Control algorithms.](#)
- c. [Operation modes.](#)
- d. [Alarm conditions.](#)

Control algorithms initiated by operation modes are tested prior to testing operation modes.

Operation modes initiated by alarm conditions are tested prior to testing alarm conditions.

Because point-to-point and actuator observations were physically made, system responses are observed from Operator workstation unless indicated otherwise.

Some equipment / component responses may be combined in a single test.

The following [control algorithm](#) testing is provided in the matrix below:

- a. Cooling tower optimization.
- b. Distribution pumping.
- c. Condenser water pumping.
- d. Chilled water bypass.
- e. Distribution pumping optimization.
- f. Cooling tower bypass.

The following operation mode testing is provided in the matrix below:

- a. Plant deactivation.
- b. Plant activation.
- c. Single chiller.
- d. Single cooling tower.
- e. Multiple chiller.
- f. Multiple cooling tower.

The following alarm condition testing is provided in the matrix below:

- a. High chilled water supply temperature.
- b. Low chilled water supply temperature.
- c. Low chilled water return temperature.
- d. High condenser water temperature.
- e. Low condenser water temperature.
- f. High chilled water flow.
- g. Chiller evaporator temperature.
- h. Chiller general fault.
- i. Cooling tower general fault.
- j. Cooling tower failure type one.
- k. Distribution pump general fault.
- l. Distribution pump failure type one.
- m. Condenser water pump general fault.
- n. Condenser water pump failure type one.
- o. Chiller failure.
- p. Cooling tower failure type two.
- q. Distribution pump failure type two.
- r. Condenser water pump failure type two.
- s. Chiller opposite status.
- t. Cooling tower opposite status.
- u. Distribution pump opposite status.
- v. Condenser water pump opposite status.

Abbreviations used in the matrix below include:

- a. Test Method:  
Manipulated parameter(s) necessary to produce expected system response.
- b. Expected Response:  
Anticipated system reaction to manipulated parameter(s).
- c. Comments:  
Commissioning specialist's issues related to observations.
- d. Pass / Fail:  
P - Expected response is observed without issues of concern.  
F - Expected response is not observed resulting in noted issues of concern.
- e. Miscellaneous:  
CS - Control signal.
