

DEDICATED OUTSIDE AIR SYSTEM - TO ZONES

1. INTRODUCTION

This sample functional performance test (FPT) procedure is for a hypothetical dedicated outside air system directly serving zones.

The following system diagram is intended to communicate information about this hypothetical system and is not required to be included as part of any FPT.

DIAGRAM SYMBOLOGY			
BCS INPUTS/OUTPUTS		SENSORS	
(AI) ANALOG INPUT	~ AVERAGING TYPE	— INSERTION TYPE	(P) HIGH/LOW PRESS LIMIT
(AO) ANALOG OUTPUT	(C) CARBON DIOXIDE	(F) LOW TEMP LIMIT	(M) CARBON MONOXIDE
(DI) DISCRETE INPUT	(CS) CURRENT	(P) PRESSURE /POSITION	(O) OPERATION MODE
(DO) DISCRETE OUTPUT	(H) HUMIDITY	~ SECTIONAL TYPE	(Q) AIRFLOW
DEVICES			
(AFD) ADJUSTABLE FREQUENCY DRIVE	(HOA) HAND-OFF-AUTO SWITCH	(FAN/PUMP)	(MOTORIZED DAMPER)
(AIRFLOW METER AIR VALVE)	(HUMIDIFIER)	(TERMINAL HEATING COIL)	(SMOKE DAMPER)

2. NOTABLE SYSTEM FEATURES

The purpose of this section is to identify notable system features to facilitate an understanding of system operation.

Notable system features include:

- a. This system is designed to provide outside air into the minimum outside air intakes of multiple variable-air-volume air handling units.
- b. Supply air fan is selected to meet 100-percent of system requirements.
- c. Exhaust air fan is selected to meet 100-percent of system requirements.
- d. Pre-heat coil is selected to meet 100-percent of requirements without credit for energy recovery device.
- e. Cooling coil is selected to meet 100-percent of requirements without credit for energy recovery device.
- f. Reheat coil is selected to meet 100-percent of requirements.
- g. [Supply air fan](#) control algorithm includes varying supply air fan speed to obtain / maintain setpoint airflow.
- h. Exhaust air fan control is accomplished by either of two Operator selectable modes of control:
 - [Exhaust air fan \(volumetric offset mode\)](#) [Default]
 - [Exhaust air fan \(facility pressure mode\)](#)
- i. [Exhaust air fan \(volumetric offset mode\)](#) [Default] control algorithm includes speed modulation of exhaust air fan in conjunction with modulation of return air control damper to maintain return air / exhaust air airflow equivalent to outside air airflow minus a predetermined volumetric offset for facility pressurization relative to the outside.
- j. [Exhaust air fan \(facility pressure mode\)](#) control algorithm includes speed modulation of exhaust air fan in conjunction with modulation of return air control damper to maintain facility pressure relative to the outside. The control algorithm includes exhaust air fan enable, exhaust air fan disable, and return air control damper minimum position to address conditions that prevent facility pressurization relative to the outside and to prevent no flow condition.
- k. [Energy recovery device](#) control algorithm includes device activation / deactivation based on dry-bulb temperature comparisons of return air and outside air using dry-bulb temperature sensors. This approach avoids reliance on relative humidity sensors possessing poorer long-term reliability than dry-bulb temperature sensors. Effectiveness of energy recovery device is not considered for cooling or heating activation / deactivation of energy recovery device.
- l. [Cooling coil](#) control algorithm includes a constant coil discharge air setpoint temperature equivalent to 55.0 °F which supports a 0.81 space sensible heat ratio for spaces at 78.0 °F dry-bulb / 58.0 °F dewpoint / 50.2-percent relative humidity. Space conditions conflict with [UFC 3-410-01 - Oct 2015](#) page 8, section 3-4.3.1.
- m. [Reheat coil](#) control algorithm includes a constant unit discharge air setpoint temperature equivalent to 73.0 °F which is the average of conditions for comfort cooling and comfort heating required by [UFC 3-410-01 - Oct 2015](#) page 8, sections 3-4.3.1 and 3-4.3.3 respectively.

- n. Pre-heat coil brine temperature, cooling coil brine temperature, and reheat coil brine temperature alarm conditions include visual indication of coils whose water-side temperature change is significantly less than design thus negatively impacting central plant efficiency.
- o. Low limit temperature (freezestat) alarm condition includes disabling associated air handling units upon activation of algorithm to prevent low temperature air being introduced into this equipment.
- p. Fire alarm condition includes disabling associated air handling units upon activation of algorithm to prevent oxygen from being introduced into this equipment and to meet requirements of life safety codes.
- q. Occupied operation mode includes enabling this system. Other operation modes such as unoccupied, timed override, and pre-occupied include this system remaining disabled.

3. CONCLUSIONS AND RECOMMENDATIONS

The purpose of this section is to identify conclusions and recommendations based on control system feature observations, point-to-point observations, actuator observations, and system operation observations.

It is concluded that this system [does / does not perform] in accordance with contract requirements.

It is recommended that this system [be / not be] accepted by the government.

The following system control enhancements are recommended:

4. TEST CONDITIONS

The purpose of this section is to identify conditions occurring at time of testing.

Test date: _____
 Test begin time: _____
 Test end time: _____
 Test begin outside air temp: _____
 Test end outside air temp: _____

5. EQUIPMENT IDENTIFICATION

The purpose of this section is to identify equipment included in this system.

Dedicated outside air unit: _____
 Pre-heat coil circ. pump: _____

6. ATTENDEES

The purpose of this section is to identify persons present during system functional performance testing.

ATTENDEES			
REPRESENTING	NAME	COMPANY	TELEPHONE NUMBER
Mechanical Commissioning Specialist:			
Owner's Representative:			
Mechanical Contractor:			
Controls Contractor:			
Test & Balance Contractor:			

7. CONTROL SYSTEM FEATURE OBSERVATIONS

The purpose of this section is to identify control system features including control point description, imbedded / visible type, adjustable / monitoring type, actual value, setpoint value / alarm range.

Abbreviations used in the matrix below include:

- a. Unit:
 Unit of measure for control point.
- b. Imbedded / Visible:
 I - Imbedded such that control point is not observable by Operator.
 V - Visible such that control point is observable by Operator.
- c. Type:
 A1 - Both setpoint and minimum / maximum alarm or alarm range are adjustable by Operator.
 A2 - Only minimum / maximum alarm or alarm range is adjustable by Operator.
 A3 - Only setpoint is adjustable by Operator.
 M - Control point is visible, but not adjustable by Operator.

d. Value / Status:

As-found imbedded or visible value or status of control point observed prior to control point(s) manipulation.

A - Status of control point is in alarm.

N - Status of control point is normal operation.

e. Setpt / Alarm Range:

Alarm Min - Alarm activated when actual value is equal to or less than alarm activation setpoint.

Setpt - Setpoint.

Alarm Max - Alarm activated when actual value is equal to or greater than alarm activation setpoint.

CONTROL SYSTEM FEATURES								
POINT DESCRIPTION	UNIT	VISIBLE / IMBEDDED	TYPE	VALUE / STATUS	SETPT / ALARM			NOTES
					ALARM MIN	SETPT	ALARM MAX	
Outside air ductwork:								
Damper position	% Open				-	-	-

8. POINT-TO-POINT OBSERVATIONS

The purpose of this section is to identify system meters and sensors have been calibrated.

Abbreviations used in the matrix below include:

a. Display:

As-found imbedded or visible value of control point documented at Operator workstation at same time measurement or observation occurred and prior to control point(s) manipulation.

Value / status is recorded for both locations when control point is displayed locally at equipment Operator workstation.

b. Measured / Observed:

As-found imbedded or visible value of control point measured or observed at same time documentation of value at Operator workstation occurred and prior to control point(s) manipulation.

POINT-TO-POINT			
POINT DESCRIPTION	DISPLAY (LOCAL / CONTROL SYSTEM)	MEASURED / OBSERVED	NOTES
Outside air ductwork:			
High limit static pressure			
Outside air section upstream of energy recovery:			
Filter differential pressure			
Dry-bulb temp			
Relative humidity			
Energy recovery device:

High limit static pressure			
Return air section upstream of energy recovery:			
Filter differential pressure			
Dry-bulb temp			
Relative humidity			
Exhaust air section downstream of energy recovery:			
Dry-bulb temp			
Relative humidity			
Exhaust air ductwork:			
High limit static pressure			
Facility:			
Facility pressure			

9. ACTUATOR AND MOTOR OBSERVATIONS

The purpose of this section is to identify actuator responses to commands from the control system.

Abbreviations used in the matrix below include:

a. Type:

A - Actuator / controlled device is controlled by an analog control signal.

D - Actuator / controlled device is controlled by a discrete (binary) control signal.

b. Maximum Command:

Control system command resulting in actuator moving controlled device to its full open position with maximum / full flow across device.

c. Minimum Command:

Control system command resulting in actuator moving controlled device to its full closed position with minimum / no flow across device.

d. Signal:

Output from control system measured in units of 0 to 100 percent, 0 to 10 volts, etc.

e. Position:

Position of controlled device (not actuator) physically observed that corresponds to control system signal observed in units of 0-percent open (minimum / no flow across device) and 100-percent open (maximum / full flow across device).

ACTUATORS AND MOTORS						
ACTUATOR DESCRIPTION	TYPE	MAXIMUM COMMAND		MINIMUM COMMAND		NOTES
		SIGNAL	POSITION / SPEED	SIGNAL	POSITION / SPEED	
Outside air control damper						
Outside air bypass control damper						
Pre-heat coil control valve						
Cooling coil Control valve						
Reheat coil control valve						
Supply air fan speed						
Return air control damper						
Exhaust air bypass control damper						
Exhaust air fan speed						

ACTUATORS AND MOTORS						
ACTUATOR DESCRIPTION	TYPE	MAXIMUM COMMAND		MINIMUM COMMAND		NOTES
		SIGNAL	POSITION / SPEED	SIGNAL	POSITION / SPEED	
Exhaust air control damper						

10. VARIABLE FREQUENCY DRIVE OBSERVATIONS

The purpose of this section is to identify characteristics of variable frequency drives (VFD's).

Procedure for obtaining characteristics included:

a. Procedure for documenting maximum motor speed allowed by VFD included:

- Record served motor's nameplate full load current
- Confirm / manually set VFD's maximum allowed speed of 60 Hz
- Manually set VFD hand-off-auto switch to "hand" position
- Manually set VFD to maximum allowed speed of 60 Hz
- Record served motor's running load current at motor conductors

b. Procedure for documenting minimum safe motor speed allowed by VFD included:

- Manually set VFD speed to 24 Hz
- Repeatedly decreased VFD speed by 3 Hz and recorded served motor's running load amperes until running load amperes increases
- Set VFD's minimum allowed speed equivalent to speed at which running load amperes increased plus 3 Hz
- Manually set VFD speed to VFD's minimum allowed speed
- Record served motor's running load amperes at motor conductors

VARIABLE FREQUENCY DRIVE INFORMATION													
PARAMETER DESCRIPTION	SERVED EQUIPMENT												
Data for maximum motor speed allowed by VFD:													
Motor nameplate full load current													
VFD maximum allowed speed (Hz)													
Running load current with VFD at 60 Hz													
Data for minimum safe motor speed allowed by VFD:													
Current at 24 Hz													
Current at 21 Hz													
Current at 18 Hz													
Current at 15 Hz													
Current at 12 Hz													

VARIABLE FREQUENCY DRIVE INFORMATION														
PARAMETER DESCRIPTION	SERVED EQUIPMENT													
Current at 9 Hz														
Current at 6 Hz														
Minimum allowed speed (Hz)														
Current at minimum allowed speed (Amps)														

11. SYSTEM OPERATION OBSERVATIONS

The purpose of this section is to document results from system-based testing of responses for each control algorithm, operation mode, and alarm condition resulting from manipulated control point(s).

Testing is sequentially grouped based on similar functions to maximize testing efficiency and is categorized as follows:

- a. As-found conditions.
- b. Control algorithms.
- c. Operation modes.
- d. Alarm conditions.

Control algorithms initiated by operation modes are tested prior to testing operation modes.

Operation modes initiated by alarm conditions are tested prior to testing alarm conditions.

Because point-to-point and actuator observations were physically made, system responses are observed from Operator workstation unless indicated otherwise.

Some equipment / component responses may be combined in a single test.

The following control algorithm testing is provided in the matrix below:

- a. Supply air fan.
- b. Exhaust air fan (volumetric offset mode) [Default].
- c. Exhaust air fan (facility pressure mode).
- d. Energy recovery device.
- e. Pre-heat coil / cooling coil.
- f. Pre-heat coil circulating pump.
- g. Reheat coil.
- h. Humidifier.

The following operation mode testing is provided in the matrix below:

- a. Unoccupied.
- b. Timed override.
- c. Pre-occupied.
- d. Occupied.

The following alarm condition testing is provided in the matrix below:

- a. Outside air filter high static pressure.
- b. Energy recovery device high static pressure.
- c. Energy recovery device effectiveness.
- d. Energy recovery device general fault.
- e. Energy recovery device failure.
- f. Energy recovery device frost.
- g. Pre-heat coil brine temperature.
- h. Pre-heat coil air temperature.
- i. Pre-heat coil circulating pump failure.
- j. Cooling coil brine temperature.
- k. Cooling coil air temperature.
- l. Reheat coil brine temperature.
- m. Discharge air temperature.
- n. Return air relative humidity.
- o. Return air filter high static pressure.
- p. Outside air / return air volumetric offset.
- q. Exhaust air fan general fault.
- r. Exhaust air fan failure.
- s. High return air ductwork static pressure.
- t. High exhaust air ductwork static pressure.
- u. Facility relative pressure.
- v. Supply air fan general fault.
- w. Supply air fan failure.
- x. High outdoor air ductwork static pressure.
- y. High supply air ductwork static pressure.
- z. Low limit temperature (freezestat).
- aa. Fire.
- bb. Emergency air distribution shutoff.
- cc. Energy recovery device opposite status.
- dd. Pre-heat coil circulating pump opposite status.
- ee. Supply air fan opposite status.
- ff. Exhaust air fan opposite status.

Abbreviations used in the matrix below include:

- a. Test Method:
Manipulated parameter(s) necessary to produce expected system response.
- b. Expected Response:
Anticipated system reaction to manipulated parameter(s).
- c. Comments:
Commissioning specialist's issues related to observations.
- d. Pass / Fail:
P - Expected response is observed without issues of concern.
F - Expected response is not observed resulting in noted issues of concern.
- e. Miscellaneous:
CS - Control signal.

SYSTEM OPERATION				
STEP	TEST METHOD	EXPECTED RESPONSE	COMMENTS	PASS/ FAIL
221	significantly less than actual temperature	System active status maintained	CS of _____	
222	Release all overrides	System returns to pre-test conditions		
Return Air Filter High Static Pressure Alarm Condition Design Control Sequence: Upon detection of receiving enable command and return air filter actual static pressure being equal to or greater than alarm setpoint of 1.5 INWG, the control system shall: <ul style="list-style-type: none"> • Initiate visual alarm at Operator workstation • Maintain system active status 				
223	To observe system response: • Force air pressure on high pressure side of differential pressure switch sampling tube	Visual alarm initiated at Operator workstation		
224		System active status maintained	CS of _____	
225	Release air pressure and return sampling tube to its original position	System returns to pre-test conditions		
Return Air / Outside Air Volumetric Offset Alarm Condition Design Control Sequence: Upon detection of receiving enable command and volumetric offset mode having been activated, the control system shall: <ul style="list-style-type: none"> • Initiate visual alarm at Operator workstation upon detection of difference between return air and outside air airflows being equal to or greater than volumetric control setpoint for a five-minute period • Maintain system active status 				
226	To observe system response: • Override return air control damper to maintain current position and exhaust air fan to constant speed	Five-minute period passes without control system action		
227		Visual alarm initiated at Operator workstation		
228	• Override volumetric control setpoint to greater than current offset	System active status maintained	CS of _____	

SYSTEM OPERATION				
STEP	TEST METHOD	EXPECTED RESPONSE	COMMENTS	PASS/ FAIL
229	Release all overrides	System returns to pre-test conditions		
Exhaust Air Fan General Fault Alarm Condition Design Control Sequence: Upon detection of receiving enable command and exhaust air fan general fault alarm, the control system shall: <ul style="list-style-type: none"> • Initiate visual alarm at Operator workstation • Maintain system active status 				
230	To observe system response: • Initiate general fault	Visual alarm initiated at Operator workstation		
231	at adjustable frequency drive	System active status maintained	CS of _____	
232	Release all overrides	System returns to pre-test conditions		
Exhaust Air Fan Failure Alarm Condition Design Control Sequence: Upon detection of receiving enable command and exhaust air failure alarm status, the control system shall: <ul style="list-style-type: none"> • Initiate visual alarm at Operator workstation • Disable exhaust air fan • Maintain system active status 				
233	To observe system response: • Initiate failure	Visual alarm initiated at Operator workstation		
234	condition at adjustable frequency drive	Exhaust air fan disabled	CS of _____	
235		System active status maintained	CS of _____	
236	Release all overrides	System returns to pre-test conditions		
High Return Air Ductwork Static Pressure Alarm Condition Design Control Sequence: Upon detection of receiving enable command and return air ductwork actual static pressure being equal to or greater than alarm setpoint of absolute 2.0 INWG, the control system shall: <ul style="list-style-type: none"> • Initiate audible and visual alarms at Operator workstation • Disable exhaust air fan • Maintain system active status 				
237	To observe system response:	Audible and visual alarms initiated at Operator workstation		

SYSTEM OPERATION				
STEP	TEST METHOD	EXPECTED RESPONSE	COMMENTS	PASS/ FAIL
238	<ul style="list-style-type: none"> Override alarm setpoint static pressure to slightly less than actual pressure 	Exhaust air fan disabled	CS of _____	
239		System active status maintained	CS of _____	
240	Release all overrides	System returns to pre-test conditions		
<p>High Exhaust Air Ductwork Static Pressure Alarm Condition</p> <p>Design Control Sequence:</p> <p>Upon detection of receiving enable command and return air ductwork actual static pressure being equal to or greater than alarm setpoint of absolute 2.0 INWG, the control system shall:</p> <ul style="list-style-type: none"> Initiate audible and visual alarms at Operator workstation Disable exhaust air fan Maintain system active status 				
241	<p>To observe system response:</p> <ul style="list-style-type: none"> Override alarm setpoint static pressure to slightly less than actual pressure 	Audible and visual alarms initiated at Operator workstation		
242		Exhaust air fan disabled	CS of _____	
243		System active status maintained	CS of _____	
244	Release all overrides	System returns to pre-test conditions		
<p>Facility Relative Pressure Alarm Condition</p> <p>Design Control Sequence:</p> <p>Upon detection of receiving enable command, the control system shall:</p> <ul style="list-style-type: none"> Initiate visual alarm at Operator workstation upon detection of facility actual pressure relative to the outside being greater than high alarm setpoint of 0.05 INWG for a five-minute period Initiate visual alarm at Operator workstation upon detection of facility actual pressure relative to the outside being less than low alarm setpoint of 0.01 INWG for a five-minute period Maintain system active status 				
245	<p>To observe system response:</p> <ul style="list-style-type: none"> Override high alarm setpoint to slightly less than actual facility actual pressure 	Five-minute period passes without control system action		
246		Visual alarm initiated at Operator workstation		
247		System active status maintained	CS of _____	

SYSTEM OPERATION				
STEP	TEST METHOD	EXPECTED RESPONSE	COMMENTS	PASS/ FAIL
248	To observe system response: • Override low alarm setpoint to slightly greater than actual facility actual pressure	Five-minute period passes without control system action		
249		Visual alarm initiated at Operator workstation		
250		System active status maintained	CS of _____	
251	Release all overrides	System returns to pre-test conditions		
<p>Supply Air Fan General Fault Alarm Condition</p> <p>Design Control Sequence:</p> <p>Upon detection of receiving enable command and supply air fan general fault alarm, the control system shall:</p> <ul style="list-style-type: none"> • Initiate visual alarm at Operator workstation • Maintain system active status 				
252	To observe system response: • Initiate general fault at adjustable frequency drive	Visual alarm initiated at Operator workstation		
253		System active status maintained	CS of _____	
254	Release all overrides	System returns to pre-test conditions		
<p>Supply Air Fan Failure Alarm Condition</p> <p>Design Control Sequence:</p> <p>Upon detection of receiving enable command and supply air failure alarm status, the control system shall:</p> <ul style="list-style-type: none"> • Initiate audible and visual alarms at Operator workstation • Disable system 				
255	To observe system response: • Initiate failure condition at adjustable frequency drive	Audible and visual alarms initiated at Operator workstation		
256		System disabled	CS of _____	
257	Release all overrides	System returns to pre-test conditions		

SYSTEM OPERATION				
STEP	TEST METHOD	EXPECTED RESPONSE	COMMENTS	PASS/ FAIL
High Outside Air Ductwork Static Pressure Alarm Condition Design Control Sequence: Upon detection of receiving enable command and return air ductwork actual static pressure being equal to or greater than alarm setpoint of absolute 2.0 INWG, the control system shall: <ul style="list-style-type: none"> • Initiate audible and visual alarms at Operator workstation • Disable system 				
258	To observe system response:	Audible and visual alarms initiated at Operator workstation		
259	<ul style="list-style-type: none"> • Override alarm setpoint static pressure to slightly less than actual pressure 	System disabled	CS of _____	
260	Release all overrides	System returns to pre-test conditions		
High Supply Air Ductwork Static Pressure Alarm Condition Design Control Sequence: Upon detection of receiving enable command and supply air ductwork actual static pressure being equal to or greater than alarm setpoint of absolute 4.0 INWG, the control system shall: <ul style="list-style-type: none"> • Initiate audible and visual alarms at Operator workstation • Disable system 				
261	To observe system response:	Audible and visual alarms initiated at Operator workstation		
262	<ul style="list-style-type: none"> • Override alarm setpoint static pressure to slightly less than actual pressure 	System disabled	CS of _____	
263	Release all overrides	System returns to pre-test conditions		

SYSTEM OPERATION				
STEP	TEST METHOD	EXPECTED RESPONSE	COMMENTS	PASS/ FAIL
Low Limit Temperature (Freezestat) Alarm Condition Design Control Sequence: Upon detection of receiving enable command and temperature downstream of pre-heat coil being equal to or less than alarm setpoint of 36.0 °F, the control system shall: <ul style="list-style-type: none"> • Initiate audible and visual alarms at Operator workstation • Disable dedicated outside air system • Command pre-heat coil control valve to its 100-percent open position • Command cooling coil control valve to its 100-percent open position • Command reheat coil control valve to its 100-percent open position • Activate pre-heat coil circulating pump control algorithm • Disable associated air handling units 				
264	To observe system response: • Manually place sensing element of low limit temperature sensor in ice water	Audible and visual alarms initiated at Operator workstation		
265		Dedicated outside air system disabled	CS of _____	
266		Pre-heat coil control valve commanded to its 100-percent open position	CS of _____	
267		Cooling coil control valve commanded to its 100-percent open position	CS of _____	
268		Reheat coil control valve commanded to its 100-percent open position	CS of _____	
269		Pre-heat coil circulating pump control algorithm activated	CS of _____	
270		Associated air handling units disabled	CS of _____	
271		Remove sensing element of low limit temperature sensor from ice water and return to its original location	System returns to pre-test conditions	

SYSTEM OPERATION				
STEP	TEST METHOD	EXPECTED RESPONSE	COMMENTS	PASS/ FAIL
<p>Fire Alarm Condition</p> <p>Design Control Sequence:</p> <p>Upon detection of receiving enable command and supply air ductwork smoke detector sensing products of combustion, the fire alarm and control systems shall:</p> <ul style="list-style-type: none"> • Initiate audible and visual alarms at Operator workstation • Disable associated air handling units • Disable dedicated outside air system 				
272	To observe system response:	Audible and visual alarms initiated at Operator workstation		
273	• Manually force artificial smoke through ductwork smoke detector sampling tube	Dedicated outside air system disabled	CS of _____	
274		Associated air handling units disabled	CS of _____	
275	Clear smoke from ductwork smoke detector sampling tube	System returns to pre-test conditions		
<p>Emergency Air Distribution Shutoff Alarm Condition</p> <p>Design Control Sequence:</p> <p>Upon detection of activation of emergency air distribution shutoff switch, the control system shall:</p> <ul style="list-style-type: none"> • Initiate audible and visual alarms at Operator workstation • Disable dedicated outside air system 				
276	To observe system response:	Audible and visual alarms initiated at Operator workstation		
277	• Activate emergency air distribution shutoff switch	Dedicated outside air system disabled	CS of _____	
278	Deactivate emergency air distribution shutoff switch	System returns to pre-test conditions		
<p>Energy Recovery Device Opposite Status Alarm Condition</p> <p>Design Control Sequence:</p> <p>Upon detection of receiving enable command and status being opposite command, the control system shall:</p> <ul style="list-style-type: none"> • Initiate visual alarm at Operator workstation • Maintain system active status 				
279	To observe system response to equipment off status:	Visual alarm initiated at Operator workstation		

SYSTEM OPERATION				
STEP	TEST METHOD	EXPECTED RESPONSE	COMMENTS	PASS/ FAIL
280	<ul style="list-style-type: none"> • Enable / confirm system active status and manually set hand-off-auto switch at adjustable frequency drive to "off" position 	Equipment and system status maintained	CS of _____	
281	To observe system response to equipment on status:	Visual alarm initiated at Operator workstation		
282	<ul style="list-style-type: none"> • Disable system and manually set hand-off-auto switch at adjustable frequency drive to "on" position 	Equipment and system status maintained	CS of _____	
283	Release all overrides	System returns to pre-test conditions		
<p>Pre-Heat Coil Circulating Pump Opposite Status Alarm Condition</p> <p>Design Control Sequence:</p> <p>Upon detection of receiving activation command and status being opposite command, the control system shall:</p> <ul style="list-style-type: none"> • Initiate visual alarm at Operator workstation • Maintain system active status
